🔒 STAY ALERT. STAY SECURE. 🔒

WHAT IS PHISHING?

A cyber attack where criminals impersonate trusted sources to steal passwords, OTPs, bank details, or install malware — typically via email, SMS, or fake websites.

GOAL

Steal passwords, OTPs & bank details or install malware

METHOD

Phishing emails, SMS (smishing), phone calls (vishing)

TARGET

Individuals, employees, executives & organizations

TYPES OF PHISHING

Email Phishing

Mass fraudulent emails impersonating banks, companies or services to harvest credentials or install malware.

SMS Phishing (Smishing)

Malicious text messages with fake links, fake prize alerts, or urgent delivery notifications.

Voice Phishing (Vishing)

Phone scams where attackers pose as IT support, bank agents, or government officials.

Spear Phishing

Highly targeted attacks using victim's personal info — name, employer, colleagues — to appear legitimate.

SIGNS OF A PHISHING EMAIL

01

Unknown or suspicious sender email address

02

Urgent language — 'Act NOW or your account will close!'

03

Grammar mistakes and poor spelling throughout

04

Suspicious or mismatched hyperlinks in message body

05

Requests for passwords, OTPs, or personal info

http://www.paypal-secure-login.net/verify

⚠ NOT SECURE

✗ **paypa1-secure-login.net**

Misspelled domain (1 instead of l)

✗ **HTTP — No padlock**

No HTTPS = no encryption

✗ **Broken page layout**

Misaligned, unprofessional design

✗ **Asks for SSN / OTP**

Unusual, unnecessary login fields

Psychological manipulation — tricking people into making security mistakes or revealing sensitive information.

IMPERSONATION

Posing as a bank, tech company, government agency, or trusted colleague. Fake logos, official-looking emails.

FEAR & URGENCY

'Your account will be suspended in 24 hours!' — panic forces fast, reckless decisions without verification.

FAKE REWARDS

'Congratulations! You won an iPhone!' or 'Claim your ₹10,000 cashback!' — baiting victims with irresistible offers.

From: security@nationalbank-alerts.net | To: you@email.com | Subject: ⚠️ URGENT: Account Verification Required

Dear Valued Customer,

⚠️ **Your bank account will be BLOCKED IMMEDIATELY.** We have detected suspicious activity on your account. Verify your identity within 2 hours or lose permanent access.

▶ <http://nationalbank-verify-secure.xyz/login>

RED FLAGS — WHY IS THIS PHISHING?

Sender domain 'nationalbank-alerts.net' ≠ official bank domain

Extreme urgency manufactured to prevent you from thinking clearly

Link points to 'nationalbank-verify-secure.xyz' — not the bank's real domain

Real banks NEVER ask you to verify your identity via an email link

Verify Sender Identity

Check the full email address carefully. If doubtful, contact sender through official channels independently.

Don't Click Unknown Links

Hover over links to preview the URL. Type addresses manually in the browser instead of clicking.

Enable Two-Factor Auth (2FA)

Even if your password is stolen, 2FA blocks unauthorized access with a second verification layer.

Use Strong Passwords

Unique, complex passwords for every account. Use a password manager — never reuse passwords.

QUICK KNOWLEDGE CHECK

Q
1

Should you click links in unexpected or suspicious emails?

✓ NO — Verify the sender independently and visit the official website by typing the URL directly.

Q
2

What does HTTPS in a URL actually guarantee?

✓ An encrypted connection — but NOT that the site is legitimate. Phishing sites also use HTTPS. Always verify the domain.

Q
3

Should you ever share your OTP with anyone, including 'bank staff'?

✓ NEVER — No legitimate bank, company or government will ever ask for your OTP. End the call immediately.

CONCLUSION

Cybersecurity is everyone's responsibility.

Stay Alert

Question every unexpected message,
call, or link

Verify Before Clicking

Confirm sender identity before taking
any action

Report Suspicious Emails

Alert your IT/security team
immediately
